

# HOPS – PENERGETIC APPLICATION SCHEDULE

Penergetic k, ideally, should be during the dormant stage of the plant -- Spring or Fall. Alternatively, the rate shown can be split and a portion applied at each end of the crop production cycle.

As shown, for best results, Penergetic p should be foliar applied at a rate of between 70 and 100 grams/acre at the following stages: First Leaf, the Start of Flowering and the Budding Stages.

≈ For additional site-specific information consult your Penergetic Distributor ≈
