

MANURE PIT TREATMENT MADE EASY

Manure pits below slatted flooring in a dairy barn can often be a management problem. Yet, when penergetic g (slurry activator) is used the former problem almost magically disappears. Typically, dairymen with in-barn manure pits that use penergetic g say: "I was never before able to pump out my manure pit as effectively as since I started using that product (penergetic g)" and "pit agitation time and in barn odor have both been dramatically reduced".

"I've been battling the sludge in one of my manure pits for over a decade. Yet, within a few weeks of applying the Penergetic G product, the sludge was liquefying and bubbling so much that my employees were asking what the heck I had put in there? I'm very impressed with what this product is doing at our dairy."
