

# **LIQUID MANURE PIT**

## **Treated with Penergetic g (Slurry Activator)**

**This pit used to have a heavy crust on its surface [Sorry no picture]. The operator was dumbfounded how effectively penergetic g caused the crust to breakup and virtually disappear. The result was the pit's liquid manure became homogeneous and rapidly agitated up into a creamy liquid consistency, easy to pump out. [Note: The light colored foam is tiny bubbles showing evidence of the slurry activation process at work.]**
