

Composting Test

October 2016

Raw

material

The City of Sherbrooke has a problem of space available for its composting air. The test was performed to confirm that PENERGETIC composts more quickly.

Test: 2000 tonnes of leaves stored for 1 year.

The material, after 1 year of storage, was only at the beginning of the composting process. We found large blocks of compact leaves almost intact. The raw material arrived in a pack of compacted leaves.

The material was put into windrow, half of which was sprinkled with 50g of PENERGETIC K ef per metric ton. The windrows were mixed with a Bacchus windrower and returned to 15 days.
